TEST RIDE

OUR RANGE OF HONDA & CAN-AM QUADS!

Try our range of ATV's for yourself this spring out in the field.

We provide the quads, the safety gear and an experienced instructor, then it's up to you to take the bikes out into the countryside and put them through their paces!

Sign up for your test ride experience on our website
www.candotracors.com

Dates, locations and details to be announced soon!

Now in stock, the **NEW Honda TRX500 Power Steering Model**,
and the **Outlander Max 500 TWO SEATER Can-Am**.

**Sign up for our ATV Test Ride Event on our
website www.candotracors.com**

can-am

MERLO CDC – Dynamic Load Control system

Merlo's revolutionary CDC - Dynamic Load Control system automatically combines attachment and telehandler to ensure best performance and safety - a new 'State of the Art' for the industry!

European Technical Standard EN15000 was introduced in late 2010, with the aim of decreasing the possibility of forward overturns. Unfortunately, the solutions implemented by most of the manufacturers impacted in the way the units could be operated, limiting some of the typical operations carried out on farms.

Now, Merlo designers have used their ability for in-house design of electronics and matched Merlo attachments to Merlo machines in a unique way that gets the very best out of both - automatically! The new Merlo CDC Dynamic Load Control system was launched at Agritechnica recently - which for the very first time provides **Automatic Implement Recognition** when Merlo attachments are used with a Merlo telehandler.

All future attachments produced at the Cuneo factory will incorporate a recognition sensor. When the attachment is connected to the hydraulically-powered fork carriage, the patented CDC system automatically recognises the attachment type, displays a little icon on the cab display, and sets an internal 'load chart' specifically matching that attachment to that telehandler.

The system measures boom angle, boom extension and loading, and works out the position of the load in space. It compares the position and load with the virtual 'load chart' and calculates the 'stability index' – simply, how much of the available stability is being used. The display shows the geometrical position of the load, digital readout of load, extension, actual load, the maximum permitted load and stability index. It doubles up the stability information with a vertical row of ascending LED's.

So, there can be no complaint about a lack of information! As the stability index approaches a pre-set figure, an alarm sounds and, finally, further aggravating motion is halted before the 100% index is reached, preventing a frontal overturn.

The CDC system also measures and controls boom descent speed, to prevent a frontal overturn being triggered by the boom motion being suddenly locked.

Be Safe, Be Legal, Get your Handler Tested at C&O Tractors

Whether you own your handler or hire it, the law demands you hold a current Report of Thorough Examination. If you fail to comply, the consequences can include risk of prosecution, fines and in some cases your insurance may be invalidated.

* At your next annual service...

..the easy way to ensure your responsibility is carried out is for our certified technicians to come to your farm and carry out the Thorough Examination on your machine plus all its attachments to give you peace of mind and make you legal. You will then carry the industry standard LOLER certificate as evidence of your safety inspection.

Attachments without recognition sensor

Older Merlo attachments, and those from third-party suppliers, will not have a recognition sensor. In this case, the operator can select one of three settings, based upon the length of the attachment load centre from the carriage. Simple attachments, such as grabs, would be relatively short (say 500mm load centre), whilst specialised ones like bale shakers would be longer.

Whichever is chosen, the CDC system works in just the same way, but is an approximation of the best load chart, rather than one exactly tailored to the attachment. The driver is protected from making an incorrect choice by hub monitors that prevent frontal tip-over. Clearly, the system is designed to make the most out of the combination of Merlo machine and Merlo attachment.

Digging mode

The biggest limitation for farmers following the introduction of EN15000 was reduced digging ability, as the telehandler is prevented from lifting the rear wheels (usually unless the boom is fully retracted).

The Merlo CDC system incorporates a 'Free Working Zone' which permits full power digging inside a specific zone, close to the ground where there is no risk associated with a forward tip, allowing the use of the machine's full potential!

When is the CDC system available?

The two top Turbofarmer models – P40.7 CS and P37.10 CS – which also incorporate suspended cabs, are fitted with the CDC system already, with the other Turbofarmer models expected to be included by Q2 2012.

Major features of Merlo CDC's system:

- Automatic Implement Recognition (AIR) matches attachment and machine for maximum performance
- Manual selection of attachment size if not equipped with AIR
- Digital cab display of maximum payload, actual payload, geometric position of the boom and stability index
- LED display of stability index
- LED and audible warning of approaching forward stability limit
- Automatic lock of aggravating boom movement at forward stability limit
- 'Free-zone' permits digging operations without limitation within zone, close to the ground
- Automatic control of descent speed outside 'Free-zone'
- Emergency system over-ride with timed two-handed control
- Improved damping to reduce false alarms and lockups
